                        This invention describes a novel protein (I) comprising identical or different catalytic domains of glycosyl transferases and which has processive activity (i.e. builds up oligosaccharide glycolipids by successive addition of glucose units). (I) can be used to produce a 3-oligoglucosyl-1, 2-diacylglycerols useful as food emulsifiers, polymer modifiers or detergents. This sequence represents a Bacillus subtilis glycosyl transferase catalytic domain which is used in the method of
                                                                                                                                                                                                                                                                                                                                                                                    360

MGDG is present in all plastids tested and is essential for cell survival, but is not present in other membrane structures, or in animal cells, and so represents a specific target. MGDG synthase or a plastid membrane isolated from plants is used to select and screen for specific inhibitors of MGDG synthase. These inhibitors are sultable as active agents against aplcomplex parasites or as herbicides. The linhibitors are used as antiparasitic agents, especially against plasmodium, Toxoplasma (particularly in patients with acquired immune deficiency syndrome) or Elmeria (coccidiosis in cattle or poultry), and as herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        pathway;

```
The present sequence represents a monogalactosyl-diacylglycerol (M3DG) synthase. MGDG is present in all plastids tested and is essential for cell survival, but is not present in other membrane structures, or in animal cells, and so represents a specific target. MGDG synthase or a plastid membrane isolated from plants is used to select and screen for specific inhibitors of MGDG synthase. These inhibitors are suitable as active agents against apicomplex parasities or as herbicides. The inhibitors are used as antiparasitic agents, especially against plasmodium, Toxoplasma (particularly in patients with acquired immune deficiency syndrome) or Eimeria (coccidiosis in cattle or poultry), and
Amino acid sequence of monogalactosyl-diacylglycerol (MGDG) synthase.

            Synthase. Middle present in all plastids tested and is essential for cell survival, but is not present in other membrane structures, or in animal cells, and so represents a specific target. MGDG synthase or a plastid membrane isolated from plants is used to select and screen for specific inhibitors of MGDG synthase. These inhibitors are suitable as active agents against aplicomplex parasites or as herbicides. The inhibitors are used as antiparasitic agents, especially against plasmodium, Toxoplasma (particularly in patients with acquired immune deficiency syndrome) or Elmeria (coccidiosis in cattle or poultry), and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       14;
                                                                                                                                                                                                                        The present sequence represents a monogalactosyl-diacylglycerol (MGDG) synthase. MGDG is present in all plastids tested and is essential for cells invival, but is not present in other membrane structures, or in animal cells, and so represents a specific target. MGDG synthase or a plastid membrane isolated from plants is used to select and screen for specific inhibitors of MGDG synthase. These inhibitors are sultable as active agents against apicomplex parasities or as herbicides. The inhibitors are used as antiparasitic agents, especially against plasmodium, Toxoplasma (particularly in patients with acquired immune deficiency syndrome) or Elmeria (coccidiosis in cattle or poultry), and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes the isolation of plant proteins which have flavonoid 5-transglycosylation (5TG) activity. Such proteins can be used in the production of plant varieties with improved colour, for example in the production of flower varieties with desired coloration and cut flowers harvested from them.

represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AZZ4537 to AZZ5576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves may also be used as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            antigen; vaccine;
meningitis; septicaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ξ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence, which is that of sucrose phosphate synthase (SPS), was deduced from a cDNA sequence obtd. from three clones isolated from a cDNA library prepd. From RNA isolated from corn leaves. The Liyptic peptides (see features) were used to design degenerative by PCR of a probe for the SPS gene. The gene can be used to prepare in sucrose regulation and carbon partitioning between starch and sucrose in photosynthesising plants. (Plants transformed with the DNA have an increased flow of sucrose to growing tissues and give increased yields). The recombinant SPS can be used to raise monoclonal antibodies which can then be used to purify the protein by

```
This protein comprises maize sucrose phosphate synthase (SPS), an enzyme that catalyses the formation of sucrose phosphate from furctose 6-phosphate and UDP-glucose in photosynthetically active plant cells. It is considered to be a rate-limiting enzyme in the plant cells. It is considered to be a rate-limiting enzyme in the pathway providing sucrose to growing tissue. The SPS amino acid contains as deduced from CDNA clones (see AAT95847) derived from CDNA. The complete protein is believed to be a dimeric or tetrameric protein having a basic subunit of 110-130 kDa. Peptides to design primers (see AAM98270) isolated from SPS were used to design primers (see AAT95848-49) utilised in the isolation of SPS cDNA. Transgenic plants that express SPS can be used to measure the effects on crop yield of an increased rate of sucrose translocation to growing tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           125 GRVIPTFNVM---TDFCLHKIWVHENVDKYYVATDYVKEKLLEI-GTHPSNVKITGIPIR 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modifying sweetness of plant parts by introducing transgene that encodes sucrose phosphate synthase - also altering ratio of soluble solids in sink tissue, especially for increasing sugar content in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The amino acid sequence (AAW09869) of maize hybrid 3184 sucrose phosphate synthase (SPS) was deduced from cDNA clones (see also AR766229) isolated from a leaf cDNA library. SPS is considered a rate-limiting enzyme in the pathway providing sucrose to growing tissue. Methods are provided for modifying the sweetness of plant sink tissue (partic, tomato fruit) in which SPS activity and/or invertase activity in plant tissues is manipulated. Carbohydrate partitioning can be modified in plant tissues and/or parts, which in turn can be used to alter plant growth, soluble solid content and/or sweetness, and/or to alter the sensitivity of plant growth to temperature and/or to levels of carbon dioxide and oxygen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sweetness; transgenic plant; tomato;

Patent No. 5917126

GENERAL INFORMATION:
APPLICANT: VAN ASSCHE, CHARLES; LANDO, DANIELLE; BRUNEAU,
APPLICANT: JEAN; VOELKER, TONI; GERVALS, MONICA
APPLICANT: JEAN; VOELKER, TONI; GERVALS, MONICA
TITLE OF INVENTION: SUCROSE PHOSPHATE SYNTHETASE (SPE),
TITLE OF INVENTION: A PREPARATION METHOD AND CDNA THEREFOR, AND USE OF THE
TITLE OF INVENTION: CDNA FOR MODIFYING SPS EXPRESSION IN PLANT CELLS
NUMBER OF SEQUENCES: 37
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                14;
